
(a) three curves the bin integrals cannot tell apart
$d\sigma/dm_{hh}$ [fb/GeV]
m_{hh} [GeV]
density + wiggle (same bin integrals)
bin averages: the "staircase"
SM $d\sigma/dm_{hh}$ (smooth model)
bin centres (where HEFTNet is trained)

(b) quadrature error, first bin (255–270 GeV), SM
relative error of the bin integral
function evaluations in the bin
Poisson noise (≈3%)
systematic, $\varepsilon = 0.08\%$
trapezoid
Gauss–Legendre
