The smooth model: the 1,000 test spectra

POWHEG against the smooth 23×80 model of $d\sigma/dm_{hh}$

Spectra are sorted by increasing total cross section (255–1455 GeV), 20 per page.

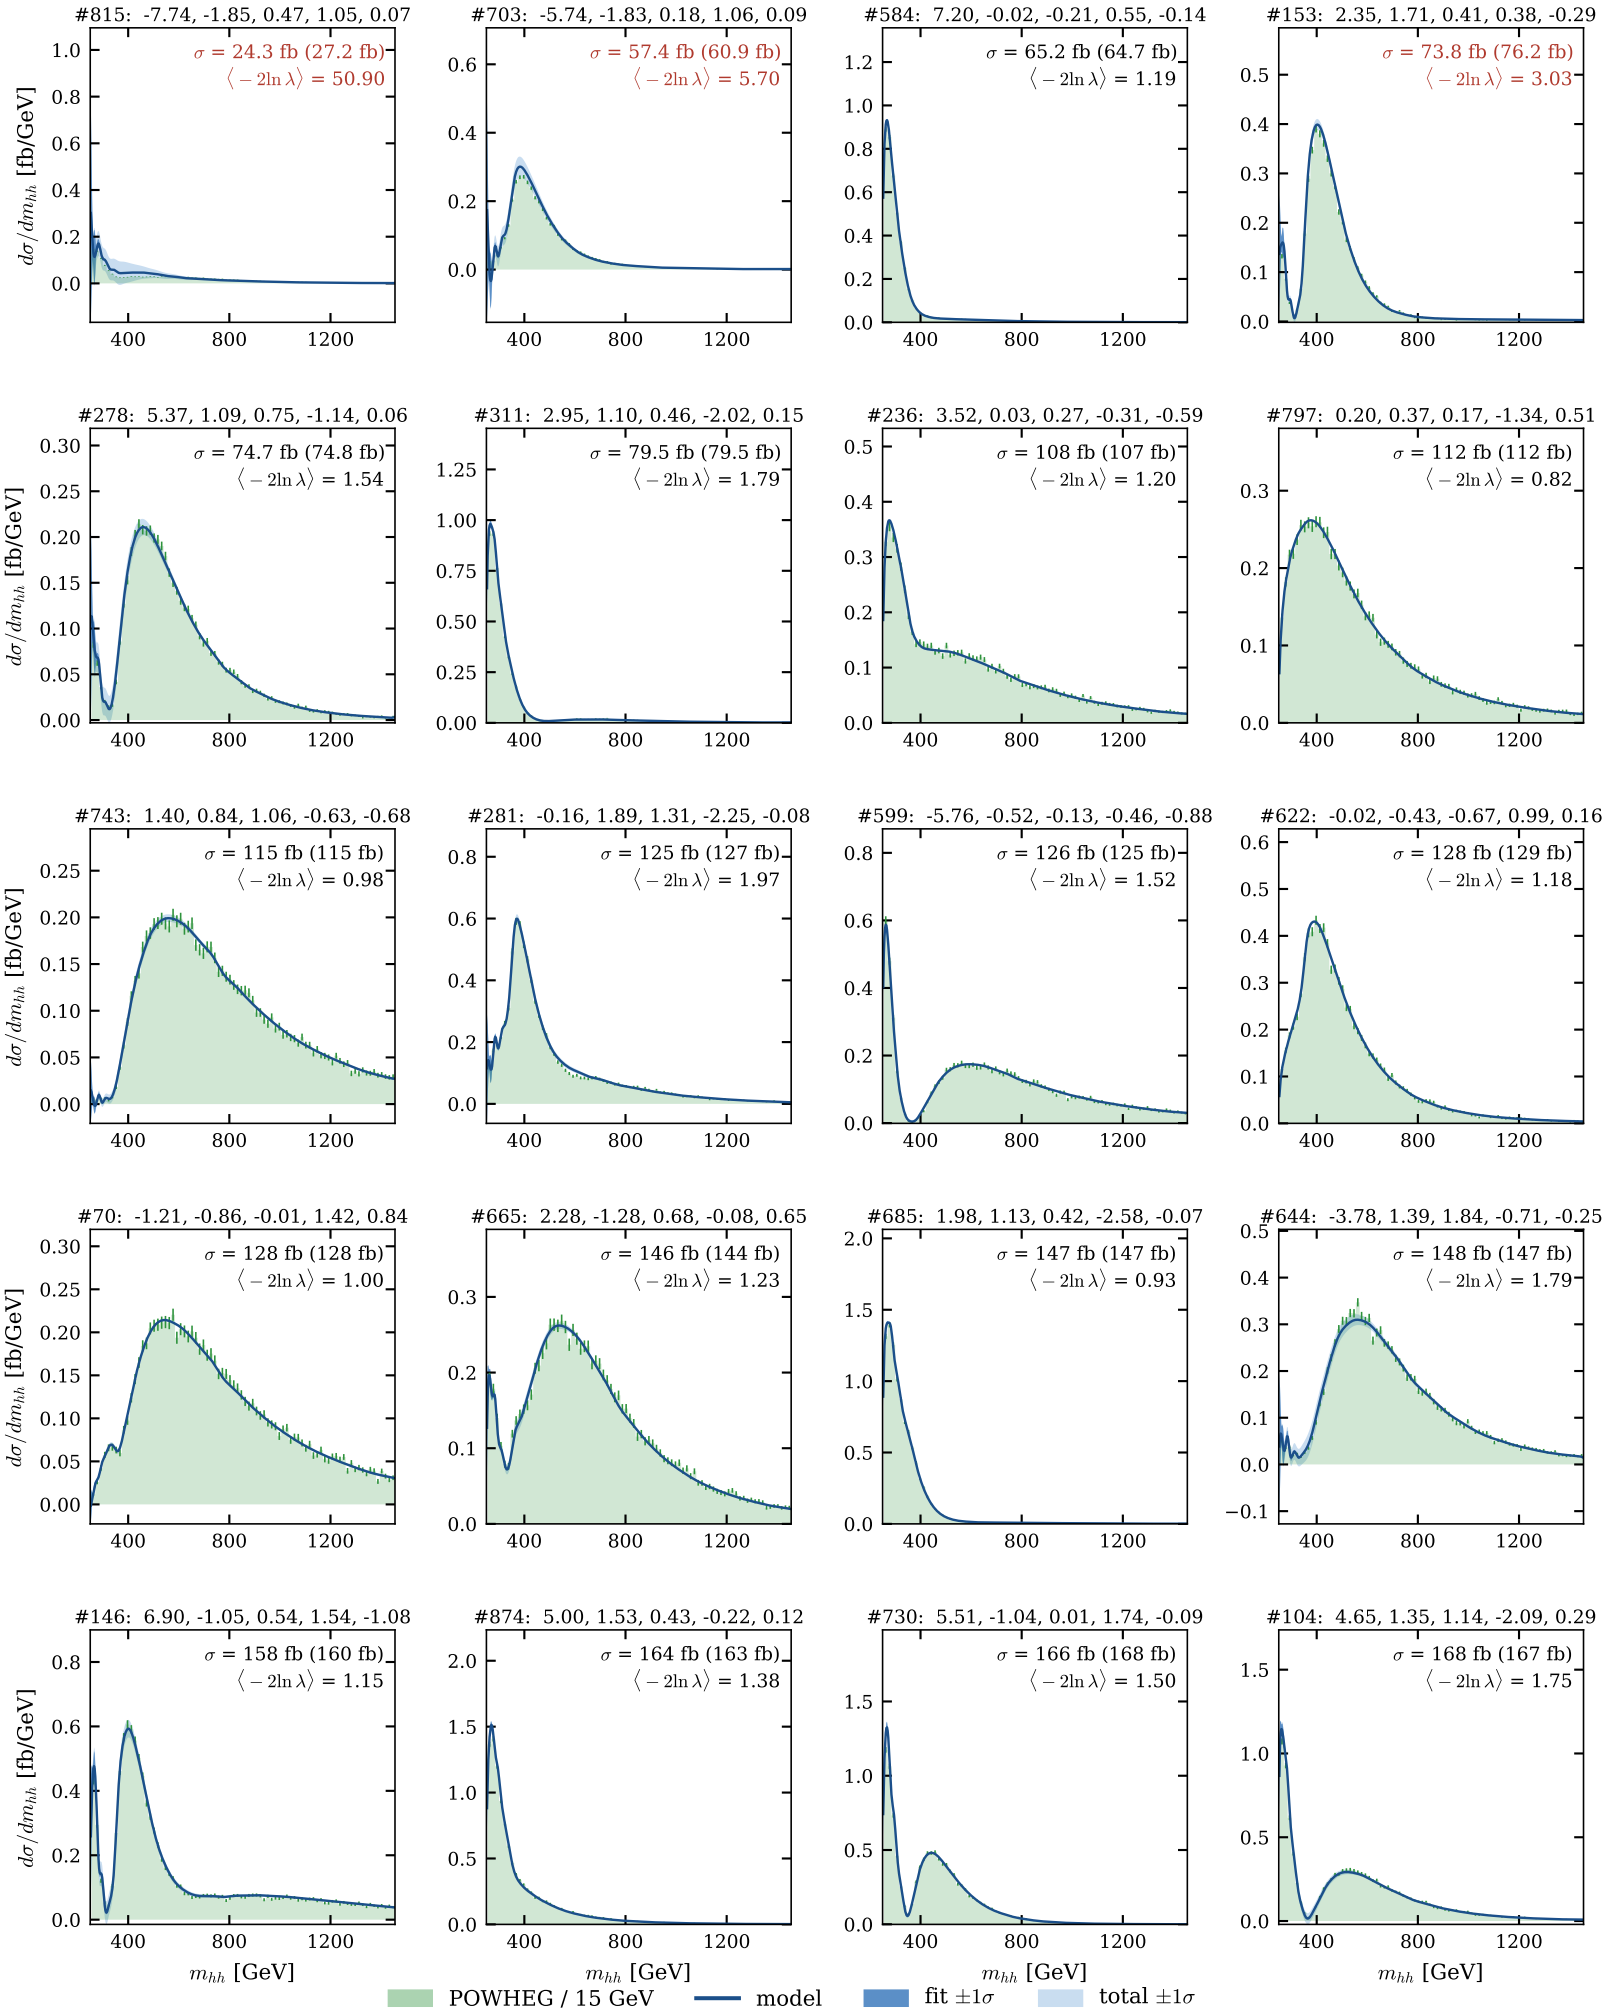

Green histogram and error bars: POWHEG divided by the 15 GeV bin width, with the Poisson noise of the scaled event counts. Blue line: the model density. Dark band: fit uncertainty ($\pm 1\sigma$, exact). Light band: total ($\pm 1\sigma$), including the discrepancy $\varepsilon(m_{hh}) \sum_i |C_i\, a_i|$.

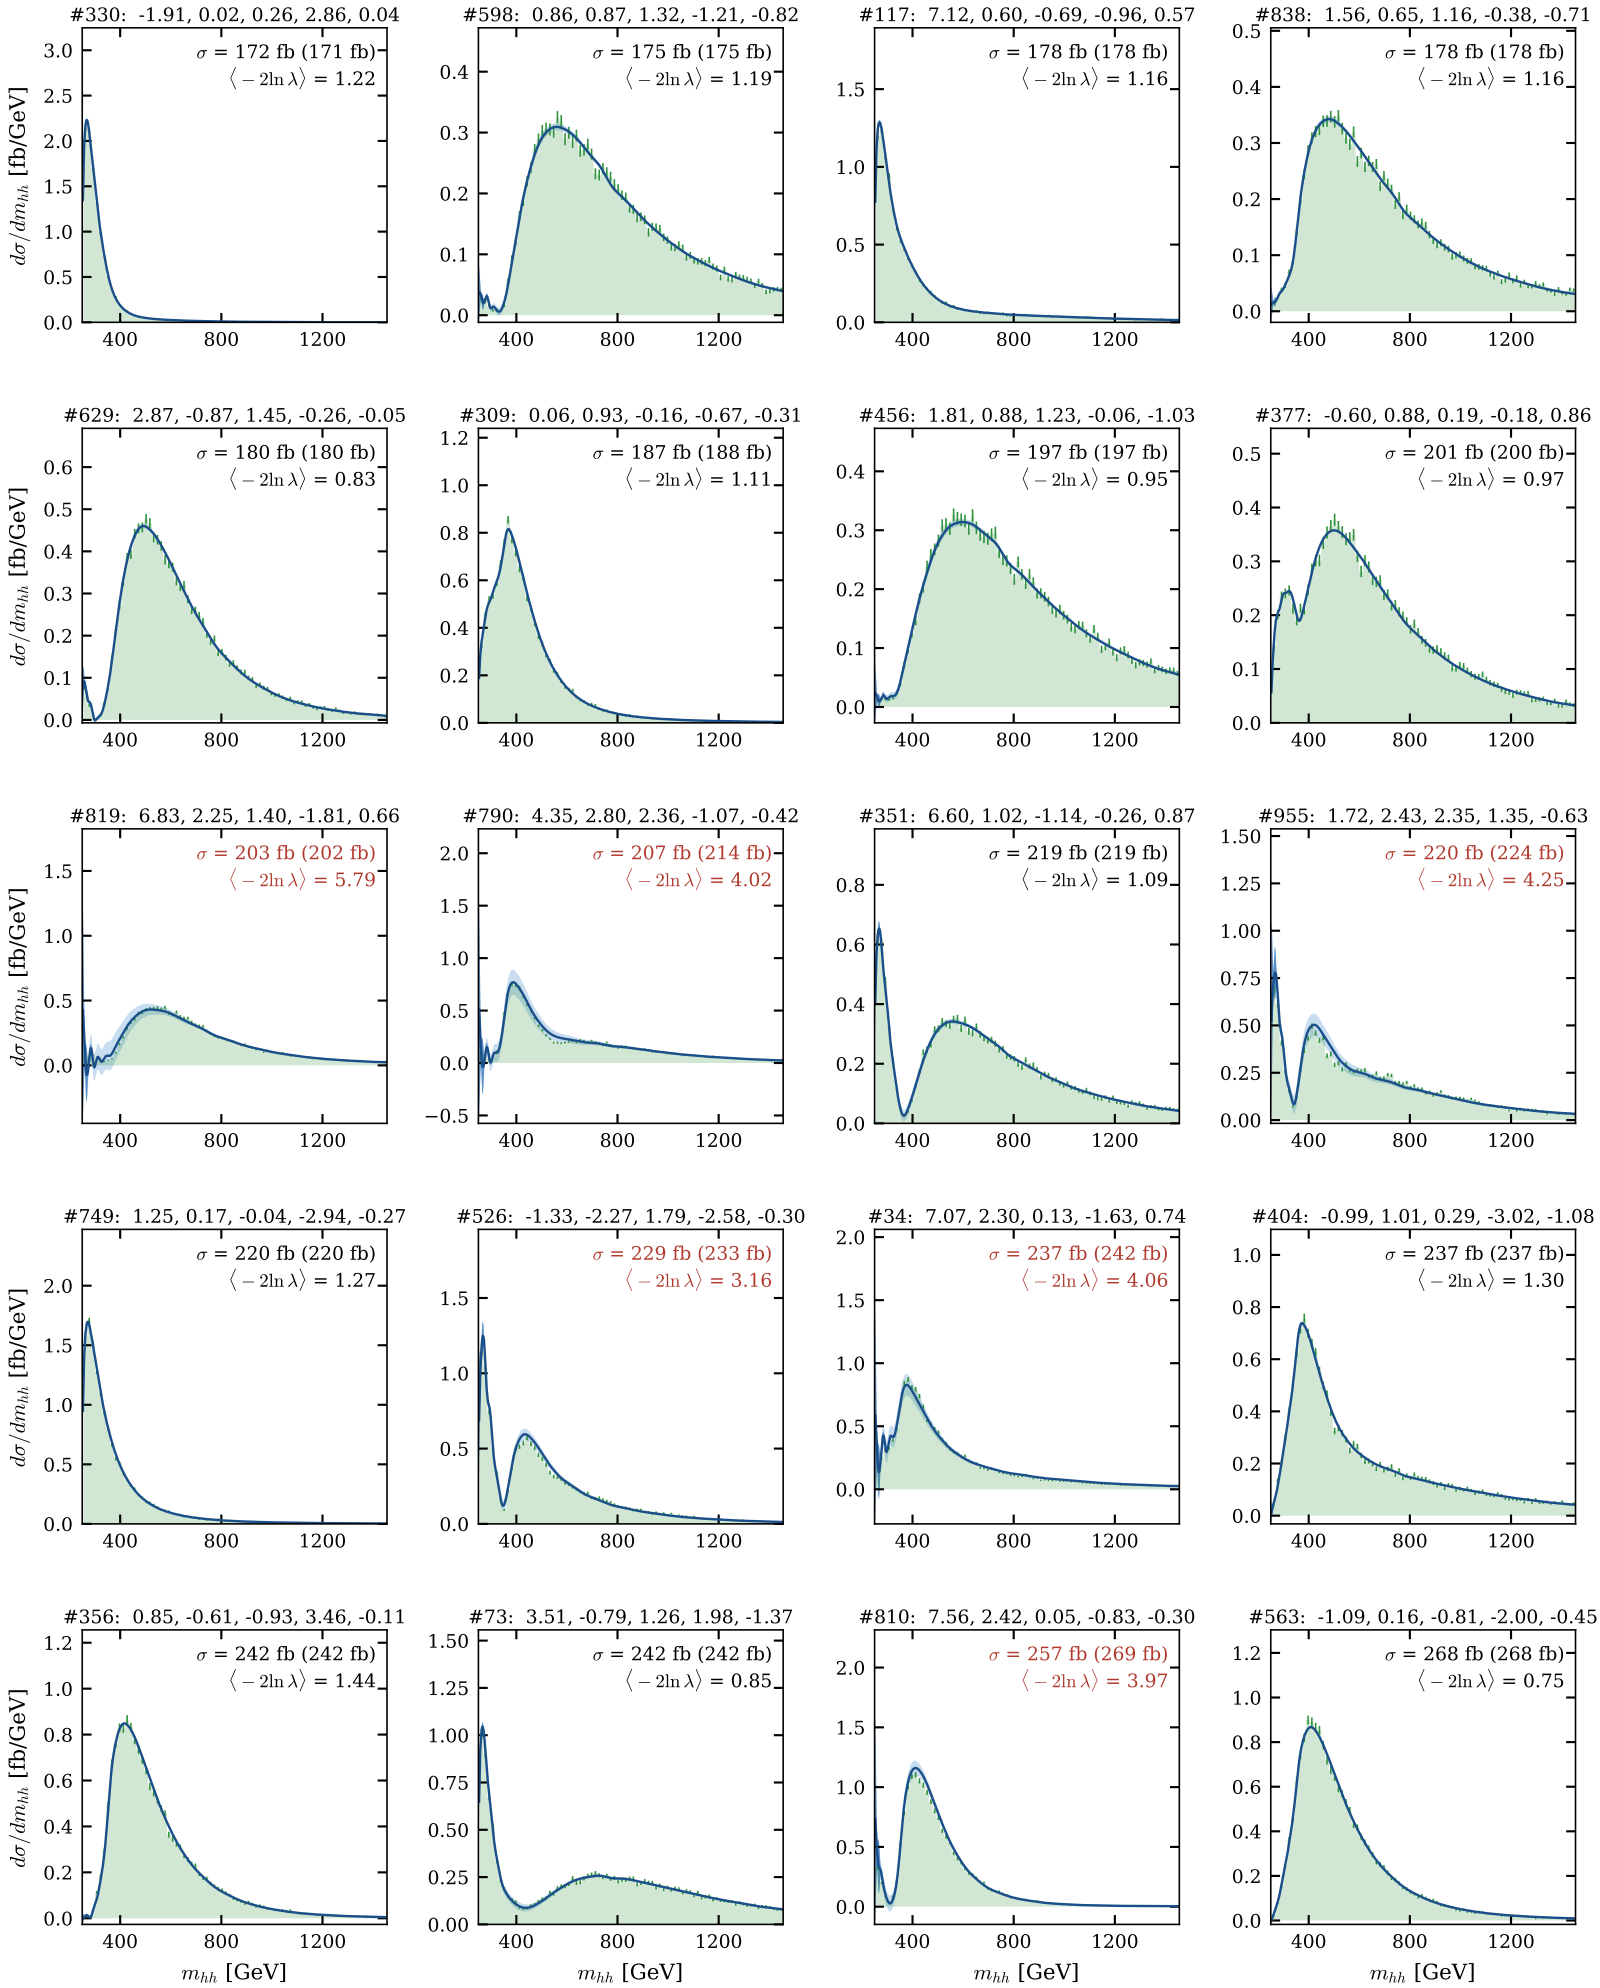

Each panel gives, above it, the test-spectrum index (row of the test file, from 0) and the HEFT parameters (κ_λ, c_t, c_{tt}, c_{ggh}, c_{gghh}); inside, the total cross section, POWHEG (model), and the likelihood-ratio statistic $-2\ln\lambda$ per bin, λ = Poisson$(n;\mu)$/Poisson$(n;n)$ (1 for a perfect model wit

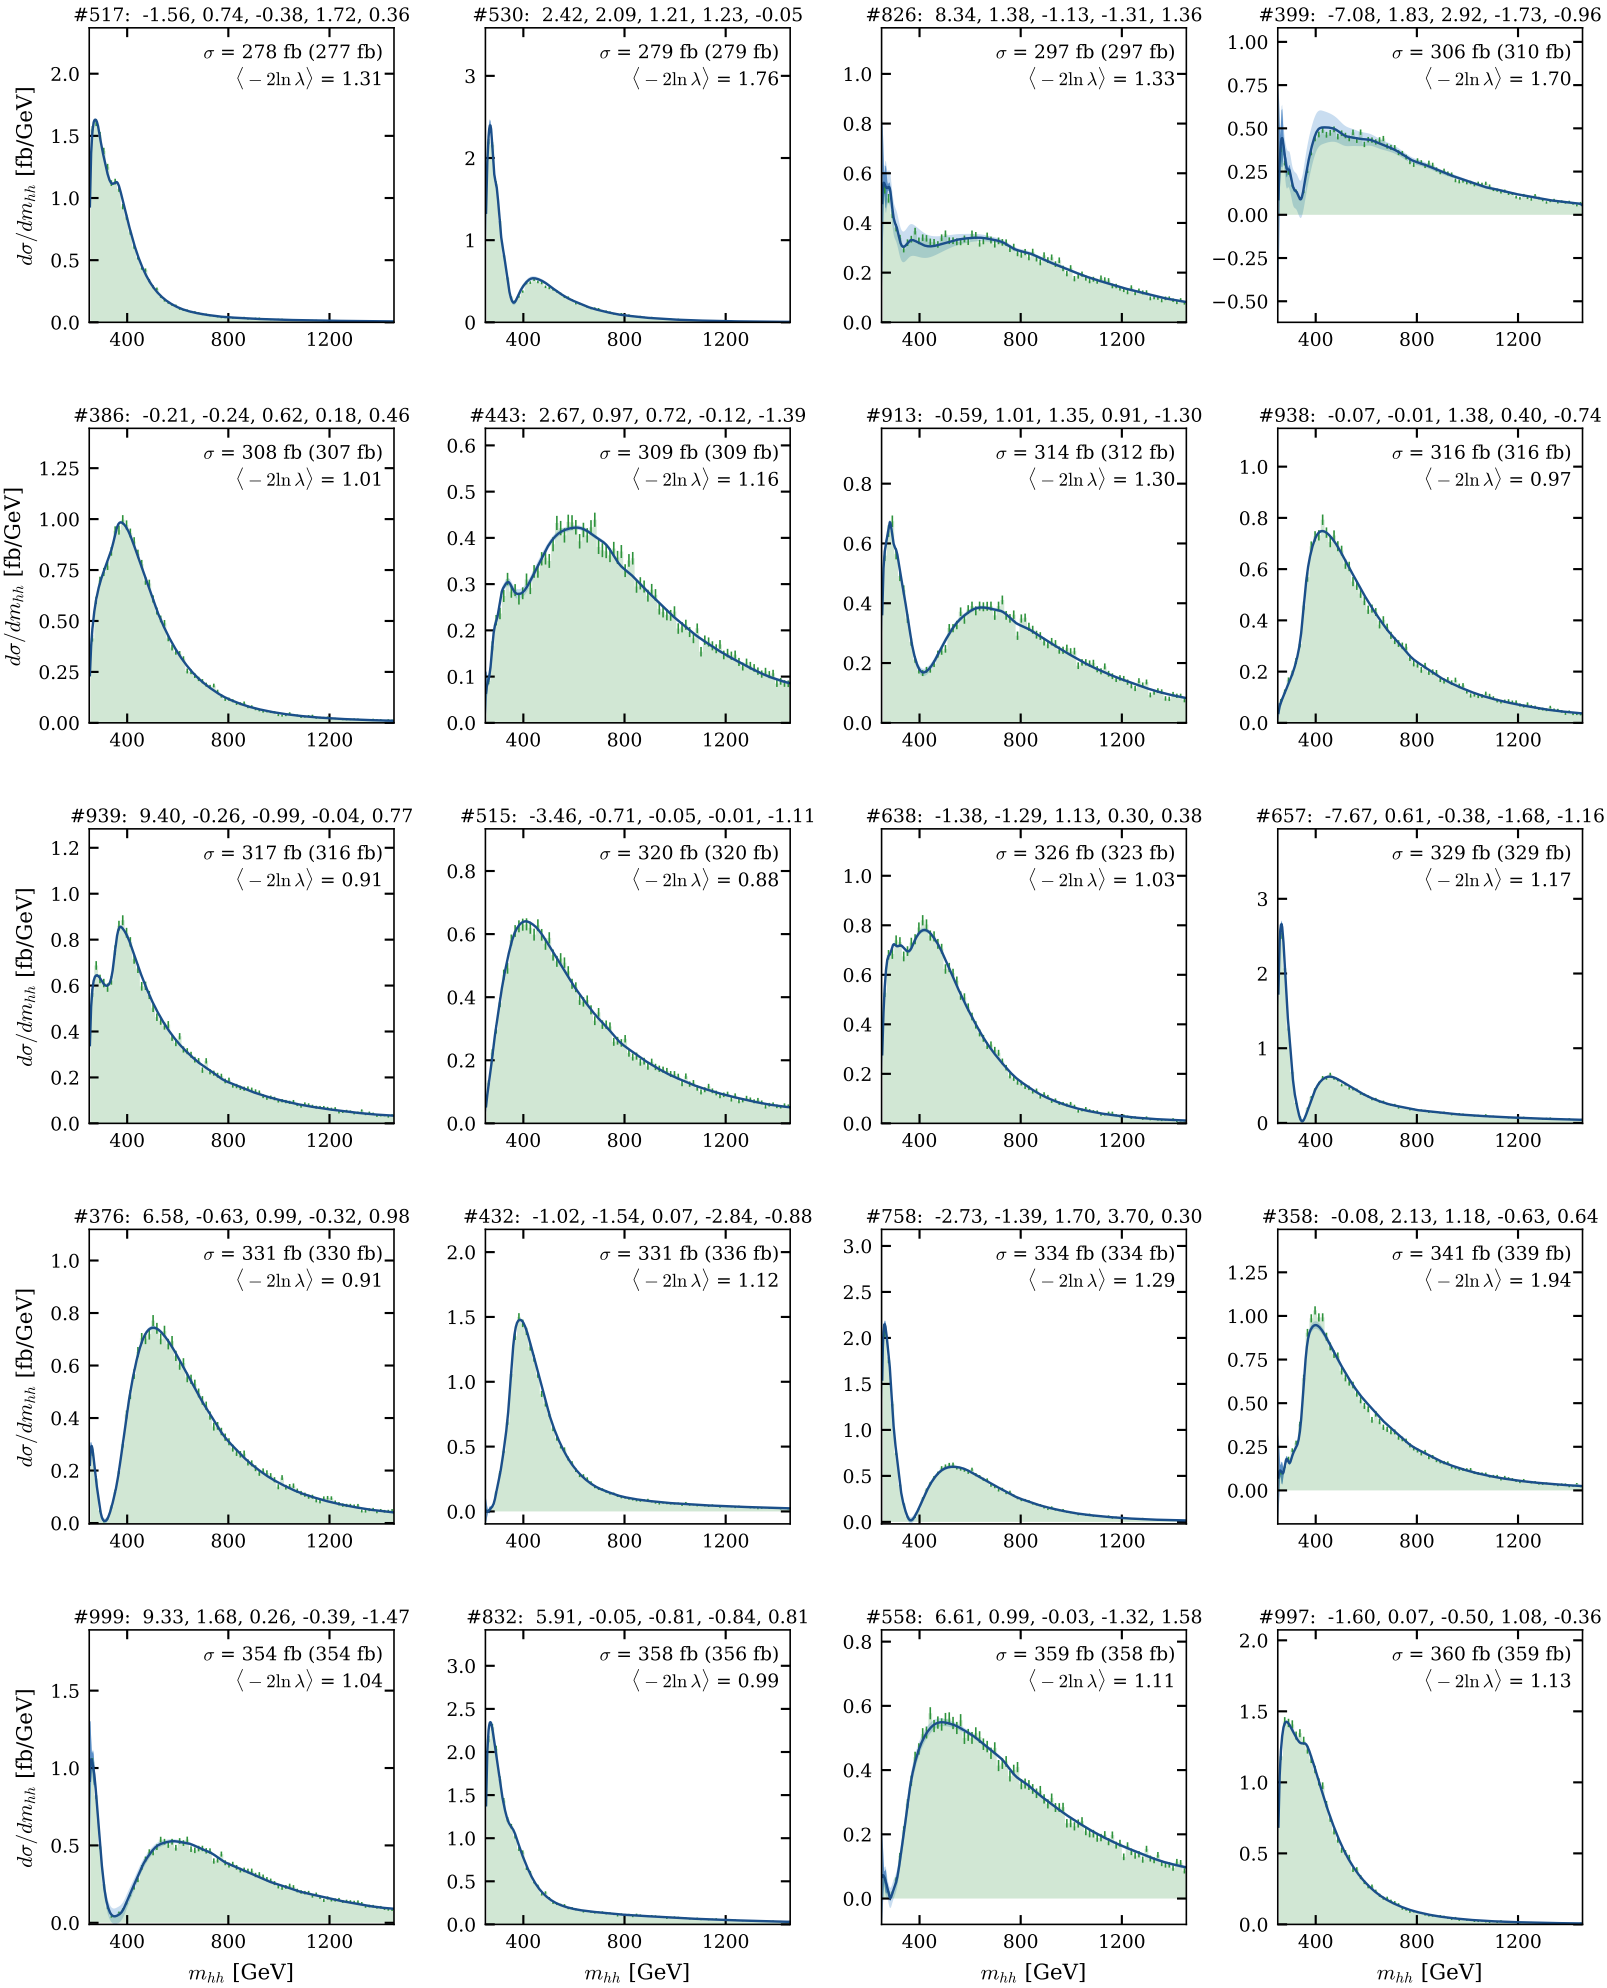

Median $-2\ln\lambda$ per bin = 1.078; spectra above 2: 27; above 5: 4.

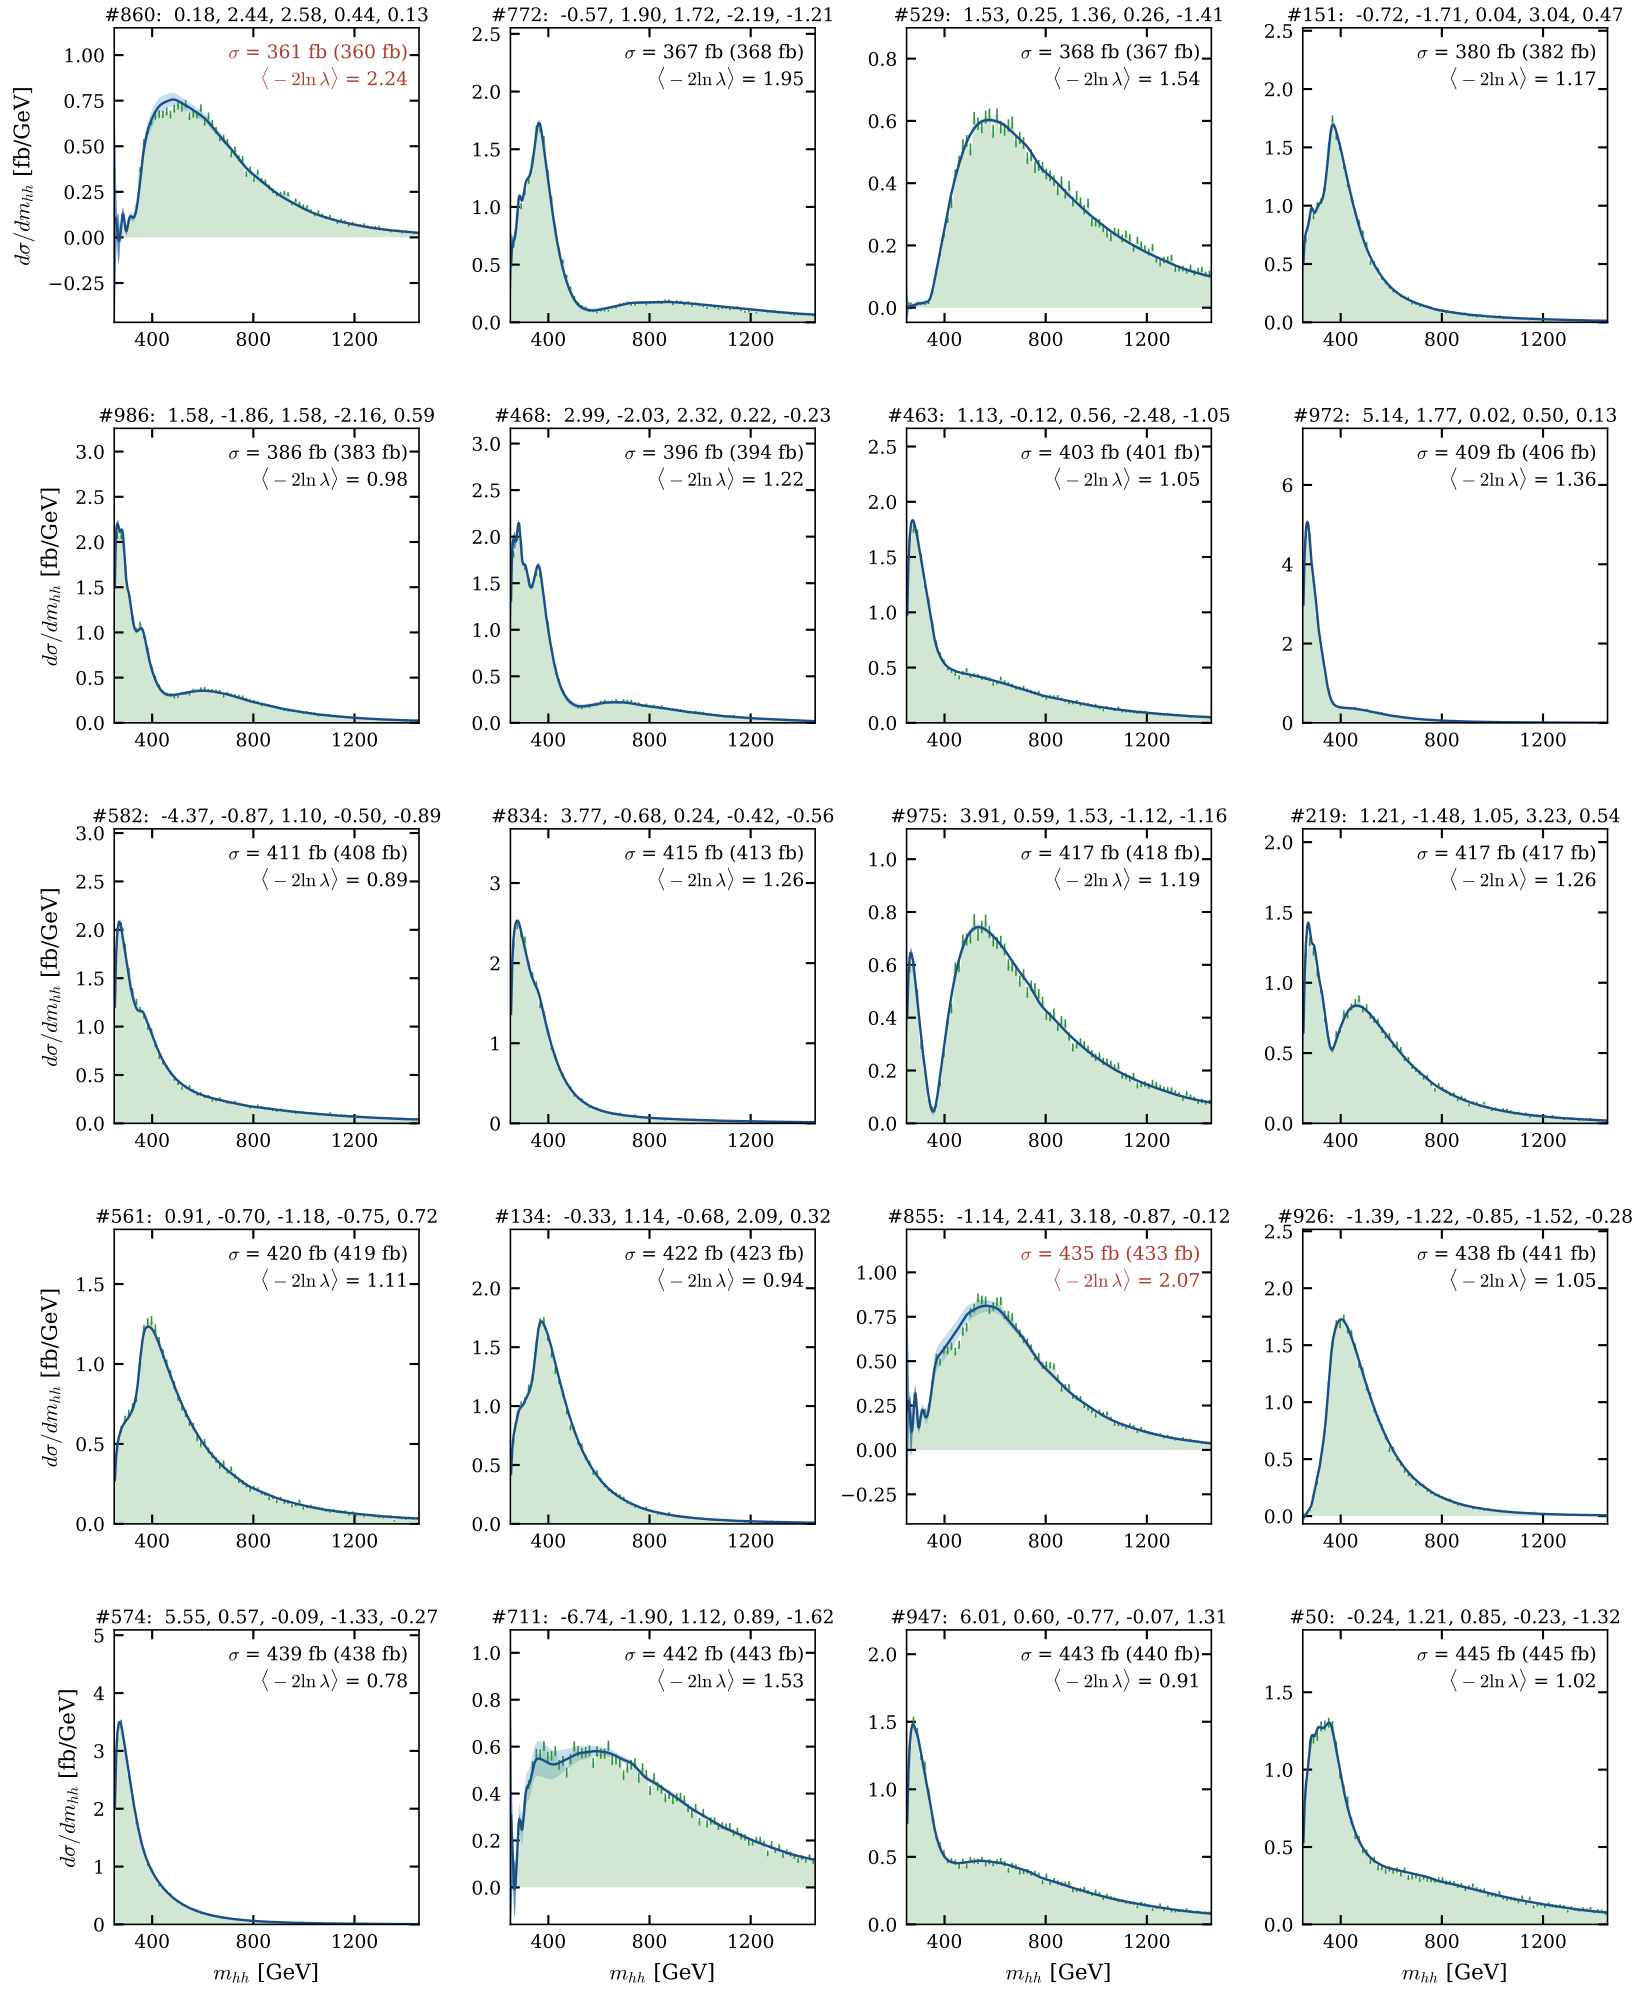

P. Bhat (Fermilab), N. De Filippis (Politecnico di Bari), K.F. Johnson, H.B. Prosper, R. Starnes (Florida State University)

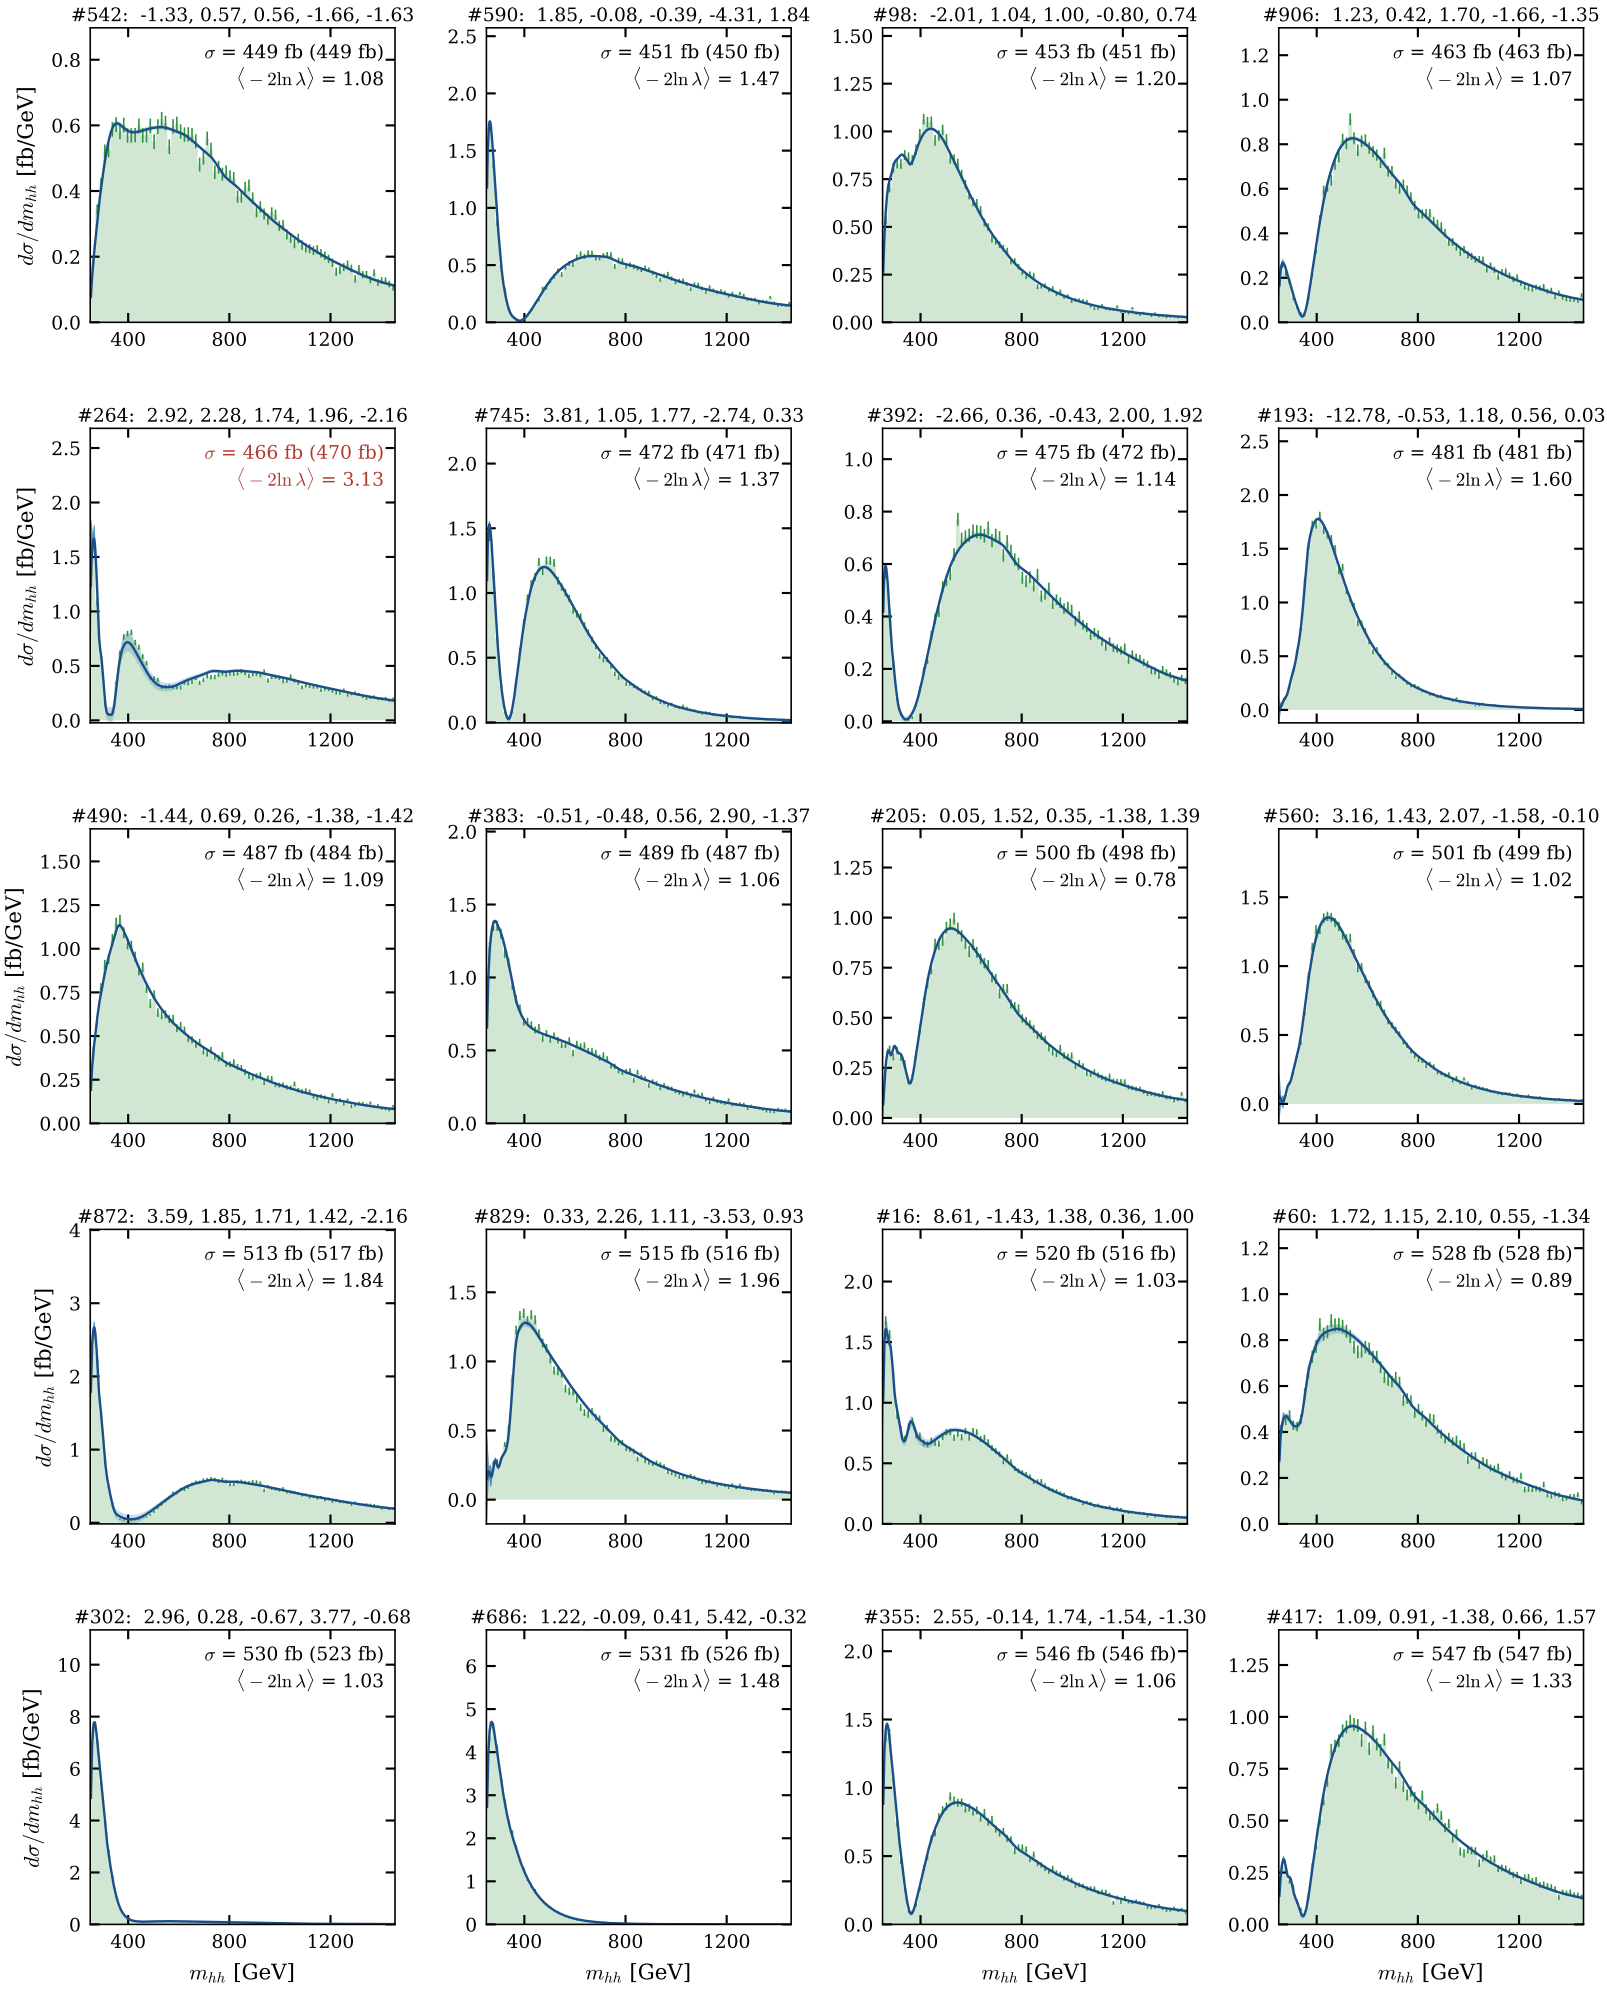

Test spectra 1–20 of 1000, by increasing total cross section (page 1 of 50)
